

Software engineer with 5+ years embedding with client teams and shipping for live ecosystem users — technical POC on Sui integrations from discovery through rollout, indexer design from requirements to sign-off, and a Bittensor dapp driving \$4.8m daily volume with feedback from a 21k-user community.

PROFESSIONAL EXPERIENCE

Sui Foundation

Solutions Engineer

Singapore

November 2025–Present

- Embed with client teams as their technical point of contact for Sui integrations — gather requirements, shape Sui-native architecture, and ship integration work alongside them from discovery through production rollout.
- As technical POC for the indexer portion of a partner payment solution, led fact-finding and requirements gathering, designed matching against up to 75 million wallet addresses at Sui's 4 cps (50–5,000 tx each), benchmarked in-memory 5,000-vs-75M lookups at 150 microseconds over 100 runs, presented architecture and results for greenlight, and implemented in production.
- Led bootcamps and hackathons as a hands-on technical instructor, walking builders through Sui integration patterns and onboarding new teams into the ecosystem.

Tensorplex Labs

Software Engineer, Full Stack

Singapore

May 2024–November 2025

- Developed and shipped the frontend of **backprop.finance**, a Bittensor Alpha Trading Exchange that scaled from **5–8M to 50–60M USD in weekly transaction volume**, reaching **36% of the network's volume**. Stack: Next.js, TailwindCSS, Node.js.
- Debugged and optimized backprop.finance frontend, using React hooks (startTransition, useDeferredValue, etc.) to prevent client blocking on our input intensive page with high amount of data displayed, React profiling tools to sieve out unnecessary re-renders, and flattening React component structures.
- Designed and deployed a Google Analytics-driven feature usage tracking pipeline that identified 2 underused features (**0.1% active user engagement**). Insights from weekly dashboard reviews has enabled data-backed re-prioritization while guiding UX redesigns that increased high-impact feature adoption.
- Built a newsletter system powered by DeepSeek-V3, served through Python's FastAPI, summarizing the latest X (Twitter) posts weekly and generating an engaging title for the curated news. Saved **2–4h/week** in manual curation and achieved **23% user engagement** via hover tracking and visibility.
- Built referral and leaderboard systems for a staking dApp, with **800+ unique wallet participants**, enhancing user engagement on discord (**21k members**) and retention incentives.
- Created an internal web-based LLM data labeling platform (FastAPI + NextJS) that streamlined prompt/output review through optimizing screen layout and keyboard navigation, increasing review speed from **>2minute** per task to under **30 seconds** per task.
- Reduced backend API latency for trading metrics from **15s to <0.5s** via a combination of in-memory caching (Redis), chunked processing, and response streamlining.

Telepathy Labs

DevOps Engineer

Singapore

November 2022–May 2024

- Restructured the CI/CD pipeline to clarify versioning and Docker images and enable parallel develop-and-test workflows.
- Automated tracking of service-owner branches, versions, and release dates so developers could stay focused on delivery.

NCS

Software Developer

Singapore

January 2021–November 2022

- Prototyped and iterated a Low Code application to digitalize the onboarding and entry process into the Organization's physical office lobby.
- Developed a document overdue module within an intelligent Document Processing application for Singapore's Attorney General Chamber, as part of solving and reducing human errors from missing important deadlines.

EDUCATION

SINGAPORE INSTITUTE OF TECHNOLOGY

Bachelor of Engineering in Infocomm Tech, Software Engineering

Singapore

September 2022

SKILLS

-
- Blockchain indexing, Move Contracts, JS, NextJS, NodeJS, PostgreSQL, Prisma, React, Kafka, Docker, FastAPI, Python
